

# Experiment: Moraines

Moraines are piles of rocks deposited by glaciers

## Materials:

Rocks  
Gelatin  
Warm Water  
Tray to collect water

1. Prepare gelatin according to directions and suspend rocks in it (like fruit)
2. After chilling, place gelatin on a tray to collect excess water
3. Pour warm water on the gelatin
4. Observe the result

## Questions to consider:

- Describe what happens when the water hits the gelatin
- Have you ever noticed objects frozen in ice?
- Have you ever noticed rocks in nature that looked out of place?
